Hubert Ofner
Specialist for Oral and Maxillofacial Surgery

Your private medical office
for

**oral and maxillofacial
surgery**

My private medical office for oral and maxillofacial surgery is located in a very beautiful art nouveau building in the immediate vicinity of the city center of

Linz. The most modern equipment of the medical office, combined with the appropriate décor in the individual rooms, create a pleasant feel-good atmosphere.

Your stay at the Medical Office

Surgical interventions are usually performed on an out-patient basis in local anesthesia. If necessary, out-patient surgical interventions can also be performed in general anesthesia. After a brief period of rest in the recovery room you can leave the medical office the same day.

Your stay at the Clinic

Surgical interventions in general anesthesia with one or more overnight stays are performed in the operating rooms at Döbling Private Hospital. After the surgical procedure you will be transferred to the in-patient ward, where you will be cared for with the greatest professional expertise and attention. Single-bed and double-bed rooms equipped with superlative facilities offer the highest degree of hotel-like comfort.

Döbling Private Hospital is one of the top addresses among the private clinics of Vienna and attends to more than 13,000 inpatients every year from Austria and abroad.

Individual personal care in a feel-good environment is the successful formula of the 160-bed Clinic.

My several years of experience as an oral and maxillofacial surgeon, coupled with ongoing advanced education in Austria and abroad, will give you the certainty of being counseled and treated with great competence at all times.

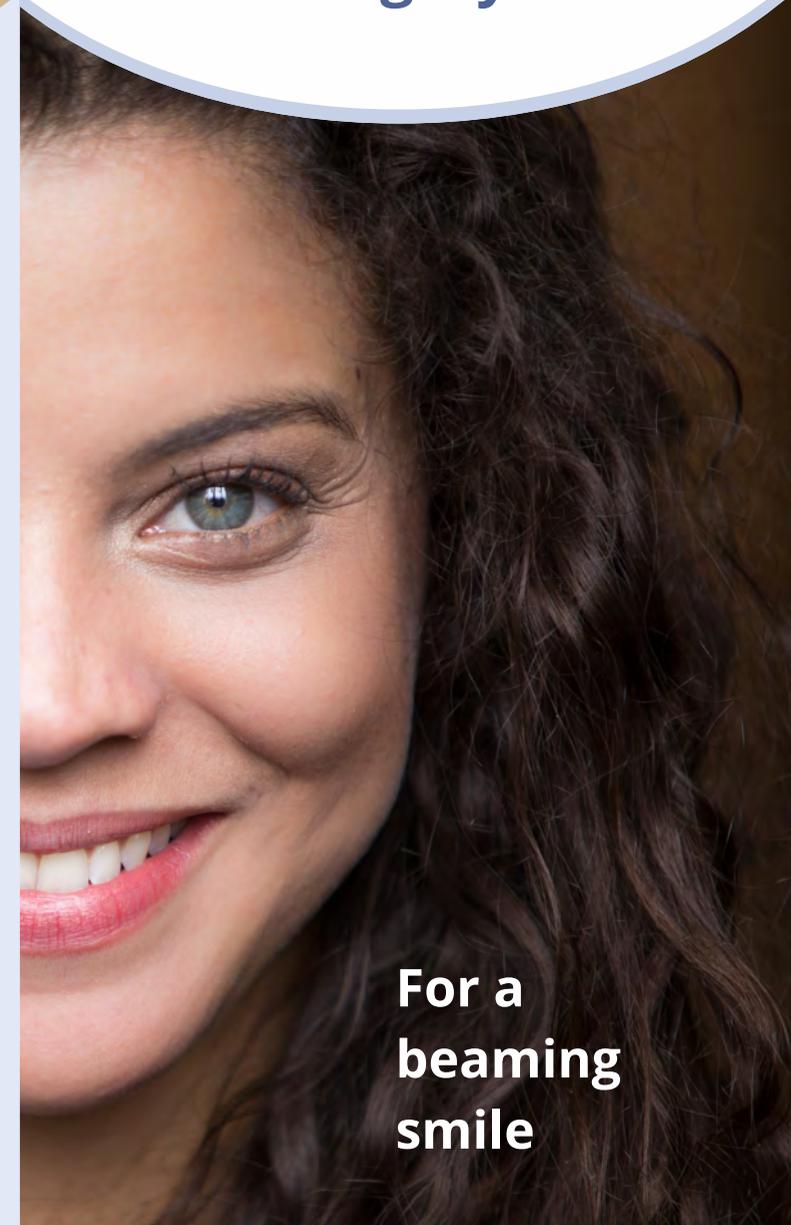

I have undergone extensive training from my apprenticeship as a dental technician to my study of general medicine, dental, oral and maxillofacial medicine and finally a specialist for oral and maxillofacial surgery. I did my training as an oral and maxillofacial surgeon at the General Hospital of Linz from 2000 to 2004, and then served as a senior physician at the Kepler University Clinic of Linz (formerly the General Hospital). **I specialized here in malposition of the jaw, the mandibular joint, jaw augmentation and rhinoplasty.** In addition to serving as senior physician, for ten years I ran a private medical office for oral and maxillofacial surgery.

From August 2017 onward I have been serving exclusively as a private doctor at my medical office and an affiliated doctor at Döbling Private Hospital.

You are welcome to make an appointment on the phone and come to my private medical office for a consultation. You can also be referred by your doctor. An individual investigation (for instance, with a three-dimensional X-ray) will be performed first, followed by a detailed conversation, and the procedure will be decided thereafter. Based on videos and models, you will be informed in detail about the procedure and the risks of the intervention. An appointment for an operation can be fixed for an out-patient or in-patient procedure.

**For a
beaming
smile**

**Professional competence
coupled with extensive
experience**

H *Healthy teeth, a beautiful smile, and harmonious proportions of the face play an important role in creating a friendly appearance and ensuring your personal wellbeing.*

Individual expert advice and an aligned treatment concept will lead to the best possible functional and esthetic results.

My private medical office, with two operating rooms equipped with state-of-the-art technology is available for medical services of highest quality. Larger operations to be performed in the hospital are conducted at Döbling Private Hospital.

My Treatment Concept

Dental surgery

All conditions pertaining to the entire spectrum of dental surgery from abscesses to cysts are treated by using gentle techniques and well-practiced procedures.

Dental implants

For an implant-borne fixed or removable dental implant we use one of the leading implant systems in the world. If necessary we prepare a computer-assisted treatment plan prior to placement of the implant.

Jaw augmentation

When there is too little bone for a dental implant, bone augmentation can be performed by using the patient's own bone or in combination with bone substitute material.

Gingival atrophy (gum loss)

A few or several exposed necks of teeth can be covered with a free connective tissue graft, using a minimally invasive tunneling technique.

Periodontitis

Surgical treatment of an inflamed periodontium (structures surrounding and supporting the teeth) should be performed when the patient has not responded satisfactorily to conservative treatment. It includes open root planing under direct viewing and, if necessary, restorative surgical measures or resection.

Rhinoplasty (Nose correction)

The profile, shape and size of the nose can be adjusted individually in patients with a trauma-related hooked or crooked nose, functional limitations, or a cleft lip and palate.

Mandibular joint

In most cases, complaints in the mandibular joint can be treated with targeted conservative measures after performing a careful investigation. Usually it is necessary to perform surgery on the mandibular joint despite conservative treatment.

Malposition of the jaw

Depending on the need for correction, the maxilla or upper jaw (Le Fort-I osteotomy), the mandible or lower jaw (bilateral sagittal split osteotomy), or both tooth-bearing portions of the jaw will be mobilized, positioned correctly in three dimensions, and fixed again.

Jaw distraction

In persons with a very small or narrow jaw, a fracture gap is created surgically and an apparatus (distractor) is used to bring the respective portion of the jaw into the desired position.

Profile correction

By performing a chin wing osteotomy, a person's profile can be improved in cases of mandibular asymmetry, a receding chin, or a markedly protruding chin.

Obstructive sleep apnea syndrome

Depending on the severity and cause, a variety of treatments may be recommended. A tooth-borne mandibular protrusion splint is a form of conservative therapy. Orthognathic surgery is a surgical option.

Anesthesia

The appropriate type of anesthesia for you will be discussed in detail. A large number of operations can be performed in local anesthesia. In cases of complex or longer operations we recommend general anesthesia. The current methods of anesthesia are extremely safe and very well tolerated.

Risks

Complications are extremely rare in persons in good general health, who adhere to the recommended postoperative measures. However, complications can never be entirely ruled out. Every operation goes hand in hand with certain risks, such as drug intolerance, hematoma, inflammation, impaired wound healing, or sensitivity disorders. Even an experienced surgeon cannot predict these in advance or avoid them in all cases. Therefore, before an operation you will be informed about all potential risks.
